KrafterPRO Documentation

KrafterPRO is a design-system and workflow plugin for **Divi 5**. It replaces element-by-element styling with fluid design tokens (variables), presets, and a guided Audit → Fix → Build → Deliver → Protect workflow, so every page you build stays on-brand and responsive.

1. Requirements

- WordPress 6.0 or newer
- PHP 8.0 or newer
- Divi 5 (5.0.0+) as the active theme (child themes work)

2. Installation

1. Make sure Divi 5 is your active theme.
2. In WordPress, go to **Plugins** → **Add New** → **Upload Plugin**, choose the KrafterPRO zip, and click **Install Now**.
3. Click **Activate**.
4. Open **KrafterPRO** in the WordPress admin menu.

KrafterPRO is unlocked through your Elegant Themes account when you buy it from the Divi Marketplace. A licensed install shows the blue licensed header. You can check your licence status at **KrafterPRO** → **Licensing**.

3. Quick start (5 minutes)

1. Go to **KrafterPRO** → **Import**.
2. Under **Start from a KrafterPRO design system**, choose the bundled design system.
3. Click **Preview Variables** and review what will be added.
4. Click **Confirm & Import**.
5. **Close the Visual Builder completely, then reopen it.** Divi caches global data, so changes will not appear until you do.
6. Run **Design Health** to see how closely your existing pages follow the new system.

Every import creates a Rollback snapshot first, so you can undo it at any time.

4. The admin screen

- **Dashboard:** overview, quick-start video, guides, support links
- **Build:** Getting Started, Design Assist, Frames, AI tools
- **Workflow:** Import, Brand Studio, Export, Rollback, Cleanup
- **Delivery:** Hand Off
- **System:** diagnostics, support bundle, activity log link
- **Connect AI:** connect Claude and other AI tools to your site
- **Licensing:** licence status

A guidance strip under the tab bar suggests the next step and clears itself when you complete it.

5. Core features

Import. Drag and drop a design-system JSON file (variables, presets, or both), or use the bundled design system. You always see a full preview before anything is written. *Merge* matches by name, updates items that changed, and skips identical ones, so re-importing never creates duplicates. *Replace* wipes and re-imports the selected scope in one step. A named snapshot can be saved with the import.

Brand Studio. Change your Primary, Secondary, Heading and Body brand settings (including fonts) without re-importing the whole design system. Preview the result, including the generated shade ramps, before you apply. Save your settings as a brand kit to reuse on other sites.

Design Health. Scan the whole site and get a score showing how closely your pages follow the design system. Each finding has a Preview that shows the before and after, and you can apply Fix on one finding or Fix all. Findings include hard-coded values that could be tokens, missing presets, and layout issues.

Design Assist (Visual Builder). Work from inside the Divi Visual Builder. Design Assist shows what would change on the current page and applies the design system's presets, clearing instance styles that a preset already covers. It only offers actions that would actually change the page.

Frames. Ready-made sections (Hero, Features, Pricing, Call to Action) built on your design system, so they pick up your colours, type and spacing.

Rollback. Snapshots are taken automatically before imports, Brand Apply and destructive resets. Restore any snapshot from the Rollback tab, rename it, or download it as JSON.

Cleanup. Find and delete variables or presets by name pattern, see where something is used before deleting, and protect prefixes you want to keep.

Export and backup. Download your design system as portable JSON, or download a full backup. Restore a backup from Import → Restore a backup, with the same preview and confirm steps as a normal import.

Hand Off and Design Guard. Hand Off creates a Client Health Report you can give to a client. Design Guard monitors the site after delivery and tells you when new content drifts away from the design system.

Activity log. Protect → Activity records who imported, applied a brand, or rolled back, and when.

6. Connect AI (optional)

Open **KrafterPRO → Connect AI** to let an AI assistant such as Claude work with your design system.

1. Check the readiness list (licence, Divi 5, Application Passwords, HTTPS).
2. Choose an **AI write access** level: Full, Content only, Drafts only or Read only. The restrictive modes lock the design system against AI changes.
3. Create a WordPress Application Password and use the copy-paste snippets to configure your AI client.

WordPress never stores the Application Password. Claude Custom Connectors need a public HTTPS site address.

7. Frequently asked questions

I imported a design system but don't see it in the Visual Builder.

Close the Visual Builder completely (not just the modal) and reopen it.

Can I undo an import?

Yes. Open Rollback and restore the snapshot taken before the import.

Will Merge create duplicates?

No. Merge matches by name and updates in place.

Does it work with a Divi child theme?

Yes.

Does it work with Divi 4?

No. KrafterPRO requires Divi 5.

A feature is locked even though I bought the plugin.

Open KrafterPRO → Licensing and confirm your Elegant Themes account is connected. Contact support if it still shows as unlicensed.

8. Support

Open **KrafterPRO → Dashboard** for guides and support links. For a problem report, open **KrafterPRO → System** and download the **support bundle** to attach to your request.
